                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins-have—therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ42264
                                          The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where
                                                                                                                                                                                                             New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                 Claim 13; SEQ ID NO 4176;
                                                                                                                                                                                                                                                                                      N-PSDB; AAC00101.

              Sequences, corresponding to human secreted proteins. AAY6453 to AAY65438 crepresent the EST-related proteins corresponding to AAZ42265 to AAX45538 crepresent the EST-related proteins corresponding to AAZ42265 to AAX43052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to procedures to identify individuals, or in process resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the candotte for the AAX42264 to AAX42660 represent sequences used in the AAX42249 to AAX42264.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                       stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ42264 and AAZ64646 to AAZ6450 represent sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                      sequences, corresponding to human secreted proteins. AAY64651 to AAY65431 represent the EST-related proteins corresponding to AAZ42265 to AAZ43052 The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development upstream regulatory regions which control the location, development
                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2000-038446/03

                                                                                                                                                                                                         The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, formers and the protein and the organism of interest. They can be used in diagnostics,
                                                                                                                                                                                                                                                                                                                                                                                                                                       25-JAN-2000; 2000US-00491404.

The invention describes a purified polypeptide, which comprises a configuration of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The cytoskeletal as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this cyolypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MFC-binding polypeptide. The polypeptides and colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at

                                                                                                                                immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and c.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                   The invention relates to human nucleic acids (AAI57798-AAI61369) and encoded polypeptides (AAM38642-AAM42213) with nootropic,
                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acids and polypeptides, useful as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2001-442253/47.

                                                                                                                                                                                                                                                                                The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide, is useful as an immunogenic composition for eliciting in a commandation of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed generation but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                          The invention describes a purified polypeptide, which comprises a confidence of a kinase, phosphatase, protease, protease inhibitor. The fragment of a kinase, phosphatase, protease, protease inhibitor. The composite, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide or the antibody that binds to this polypeptide. It is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class I MHC-binding polypeptide. The polypeptides and polypeptides and polypeptide. The polypeptides and colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at

The cytoskeletal protein, receptor or transcription factor. The CC transporter, cytoskeletal protein, receptor or transcription factor. The CC polypeptide is useful as an immunogenic composition for eliciting in a command an immunogenic response directed against any of the purified polypeptide, is useful for treating cancer. The antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also composition for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, colon cancer, in the sequence represents an cappeased protein tag (EPT) isolated from human tissue for translational corresponded protein tag (EPT) isolated from human tissue for translational corrections. Sequence does not appear in the printed correct for translational corrections and specification but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                               The invention relates to a method for identifying a protein tyrosine phosphatase (PTP) that is reversibly oxidized in a cell by: (i) subjecting a sample, including a cell that contains at least one PTP, to conditions that cause reversible oxidation of PTP; (ii) isolating PTP anaerobically, in presence of a sulfhydryl-reactive agent (II) that irreversibly modifies the thiol group of an invariant Cys in the active site of PTP; and (iii) determining, under reducing conditions, the level of dephosphorylation, caused by PTP, of a labelled substrate (III), where dephosphorylation indicates that an active PTP is present. No details of tests for these activities are given. The method is used to identify modify such PTP, or (b) alter inducible signalling pathways in which PTP are involved. These agents are potentially useful, in human or veterinary medicine, for treating abnormal cell proliferation or growth (cancer);
                                                                                                                                                                                                                                     guest vs. host disease; autoimmune diseases; allergy or other immunosuppressed states; metabolic disorders and cell-cycle abnormalities. This sequence represents one of the PTP enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       screening

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

                                                                                                                                                                                                                                                                                                                                                            immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Inmune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening,
Translational profiling; expressed protein tag; EPT; kinase; phoprotease; protease inhibitor; transporter; cytoskeletal protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a purified polypeptide, which comprises a CC fragment of a kinase, phosphatase, protease, protease inhibitor. The crasporter, cytoskeletal protein, receptor or transcription factor. The CC transporter, cytoskeletal protein, receptor or transcription factor. The collection as an immunogenic composition for eliciting in a commandal an immunogenic response directed against any of the purified polypeptide. The purified protein for treating cancer. The polypeptide is also composition for identifying compounds that binds to a naturally processed compounds that binds to a naturally processed compounds to a naturally processed compounds of the polypeptide and compounds that binds to a naturally processed compounds of the polypeptide and compounds are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, colon, 
                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                therapy. The human KPP proteins and polynucleotides can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of KPP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. AIDS, epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. Hypochyroidism, Cushing's syndrome) disorders, or infections. They can also be used in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of KPP. The KPP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human kinases and phosphatases (KPP) for diagnosing, treating and preventing diseases or conditions associated with aberrant KPP expression e.g. cancer, acquired immunodeficiency syndrome, epilepsy, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         20-FEB-2003; 2003US-0449059P.

This invention relates to a novel method for identifying genes that are cover-expressed in adipose tissue and as such it provides targets for anti-
cobesity pharmaceutical compositions. Specifically, it refers to a high-
mobility group I-C protein (HMGI-C) that is associated with obesity and 
is epistatic to leptin, furthermore, it refers to the observe where an 
autosomal recessive trait is linked to obesity and diabetes. The present 
invention describes performing differential gene expression analysis 
between the white adipose tissue (MAT) or stromal vascular tissue (SVT) 
of any two different mice selected from a group consisting of wild-type, 
the first of that are adipocyte specific, and as such can be used for 
preventing adipogenesis, diagnosing and treating diabetes, obesity, 
hypertension and cardiovascular disease, as well as screening for 
compounds that can modulate or prevent adipogenesis and treat diabetes or 
obesity. These compositions exhibit anorectic, antidiabetic and 
human homologue of 
mysterial adipogenesis. This polypeptide sequence is a human homologue of
                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            high mobility adipogenesis; antidiabetic;

                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to diagnosing or monitoring transplant crejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic cislet, lung, bone marrow or stem cell transplant rejection, in an individual. The methods are also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein encoded by an mRNA sequence of the invention which show altered expression in renal transplantation and expression.
                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                CC comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an CC altered risk for myocardial infarction in the individual's nucleic acids, where the presence of the SNP is correlated with an CC altered risk for myocardial infarction in the individual. The invention CC further comprises: an isolated nucleic acid molecule comprising at least CC 8 contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino CC acid sequence given in the specification; an antibody comprising an amino acid sequence given in the specification; an antibody that specification and which is between about 16 and 1000 nucleotides in CC fragment; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in CC length; a kit for detecting an SNP in a nucleic acid, comprising the polynucleotide, a buffer and an enzyme; a method of detecting an SNP in a method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity.
                                                                                                 Query Match

                                                                                                                                                                                                  composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction-associated gene containing one or more SNP's of the invention. Note sequence was not shown in the specification. The sequence has come an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                      The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing composition for treating or preventing myocardial infarction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor.

C transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed sequence in the printed sequence that was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                        The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polypucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational
                                                                                                    expressed protein tag (RPT) isolated from human tissue for traprofiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly if tp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a purified polypeptide, which comprises a CC fragment of a kinase, phosphatase, protease, protease inhibitor, CC transporter, cytoskeletal protein, receptor or transcription factor. The CC polypeptide is useful as an immunogenic composition for eliciting in a CC mammal an immunogenic response directed against any of the purified CC polypeptide. The purified polypeptide, or the antibody that binds to this CC useful for identifying compounds that binds to a naturally processed CC useful for class I MHC-binding polypeptide. The polypeptide is also CC useful for class I MHC-binding polypeptide. The polypeptides and CC polynucleotides are particularly useful for treating or preventing CC myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, CC lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an CC expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for identifying a protein tyrosine CC phosphatase (PTP) that is reversibly oxidized in a cell by: (i) subjecting a sample, including a cell that contains at least one PTP, to CC conditions that cause reversible oxidation of pTP; (ii) isolating PTP CC anaerobically, in presence of a sulfhydryl-reactive agent (II) that contains that cause reversible oxidation of pTP; (ii) isolating PTP CC irreversibly modifies the thiol group of an invariant Cys in the active contract of PTP; and (iii) determining, under reducing conditions, the level of dephosphorylation, caused by PTP, of a labelled substrate (III), where CC dephosphorylation indicates that an active PTP is present. No details CC dephosphorylation indicates that an active PTP is used to identify contained CC dephosphorylation indicates are given. The method is used to identify CC reversibly oxidized PTP, also to identify agents that: (a) reversibly CC modify such PTP; or (b) alter inducible signalling pathways in which PTP CC are involved. These agents are potentially useful, in human or veterinary CC medicine, for treating abnormal cell proliferation or growth (cancer); consist vs. host disease; autoimmune diseases; allergy or other immunosuppressed states; metabolic disorders and cell-cycle.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antigout, antiinflammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as rheumatoid arthritis, lupus, ankylosing spondylitis, fibrositis, fibrositis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an immune disease caused by an infectious agent. This sequence represents a protein sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic format from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention further comprises: a treatment of rheumatoid arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collageninduced arthritis; and reducing the symptoms associated with collagendativities: immunosuppressive, antirheumatoid, antiarthritic, osteopathic, antirottes artificial arms for the antirheumatoid, antiarthritic, osteopathic, antirottes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens
human; adipocyte specific; adipose tissue; anti-obesity;
                                                                  Human adipocyte specific leukocyte common antigen protein SeqID 563
                                                                                                                                            03-JUN-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1304
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          patient sample containing mRNA, analysing gene expression using the mRN that results in a gene expression signature of the mRNA, and using that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            between the white addpose tissue (WAT) or stromal vascular tissue (SVT) of any two different mice selected from a group consisting of wild-type, HMGI-C-/-, ob/ob, or HMGI-C-/- ob/ob genotype mice. Accordingly, using this method novel nucleotides and the encoded proteins thereof were identified that are adipocyte specific, and as such can be used for preventing addpogenesis, diagnosing and treating diabetes, obseity, hypertension and cardiovascular disease, as well as screening for compounds that can modulate or prevent adipogenesis and treat diabetes or obesity. These compositions exhibit anorectic, antidiabetic and hypotensive activities. This polypeptide sequence is a human homologue of a murine adipocyte specific protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for identifying genes that are over-expressed in adipose tissue and as such it provides targets for anti-
-obesity pharmaceutical compositions. Specifically, it refers to a high mobility group I-C protein (HMGI-C) that is associated with obesity and is epistatic to leptin, furthermore, it refers to the ob-gene where an autosomal recessive trait is linked to obesity and diabetes. The present invention describes performing differential gene expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying adipocyte specific genes, useful for treating obesity or diabetes, and for identifying drug targets, by differential gene expression analysis between adipose tissue or stromal vascular tissue mice of different genotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    high mobility group I-C protein; HMGI-C; obesity; leptin; ob; diabetes; adipogenesis; hypertension; cardiovascular disease; anorectic; antidiabetic; hypotensive; leukocyte common antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1304
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; SEQ ID NO 563; 91pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29-JUL-2002; 2002US-0398785P.

The invention relates to an isolated nucleic acid comprising at least 10 contiguous nucleotides of any of the 233 polynucleotide sequences given in the specification, or its complement. The nucleic acids encode cancer-associated proteins. Also included are an expression vector comprising the above recombinant nucleic acid cited above, a host cell comprising the above a cancer-associated (CA) nucleic acid comprising at least no contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least no pen reading frame of a CA sequence selected from any of the 25 complement), an isolated antibody, or its antigen binding fragment) that binds to the above polypeptide, a hybridoma that produces the above compositional antibody, a pharmaceutical composition comprising the above contibudy and a pharmaceutical excipient, a kit for detecting cancer continuitional, a method for inhibiting growth of cancer cells in an conditional, a method for inhibiting growth of cancer cells in an conditional, a method for delivering a therapeutic agent to cancer cells in an individual, an electronic library comprising the above polypeptide or anticancer activity or for a bioactive agent capable of modulating concer associated with expression of a polypeptide in a test cell sample, a method for treating cancers and a method for inhibiting the expression of composition and methods are useful for detecting, diagnosing, preventing and treating cancers, especially lymphoma and

acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody that specifically binds to the polypeptide or its antigen-binding fragment; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid, comprising the polynucleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises: an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism the individual's nucleic acids.

```

RESULT 30 ADQ39375 ID ADQ39

ADQ39375 standard; protein; 1306 AA.

18-NOV-2004 ADQ39375;

(first entry)

cardiant; gene therapy; human.

Myocardial infarction; detection; single nucleotide polymorphism; SNP; Human myocardial infarction-associated gene derived protein, SEQ ID 1038 밁

σ

KLLAFGFAFL 15

```
Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.
Sequence 1306 AA;

8 contiguous mucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody that specificatly binds to the polypeptide or its antigen-binding fragment; an amplified polymucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid, comprising the nucleic acid molecule; a method of detecting an SNP in a nucleic acid, comprising the nucleic acid molecule; a method of detecting an SNP in a method of detecting an SNP in a method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing infarction and for preparing a composition for treating or preventing myocardial infarction. This The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises: an isolated nucleic acid molecule comprising at least further comprises: an isolated nucleic acid molecule comprising at least sequence represents the protein of a human myocardial infarction-associated gene containing one or more SNP's of the invention. Note: The sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website. an antibody This

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polymucleotides encoding the CD45 peptides. The activated CTLs are useful for killing, and in the manufacture of a medicament for, target cells expressing the CD45 peptides in a patient. A T cell receptor (TCR), recognising cells expressing the CD45 peptides, is useful for killing target cells (cancer cells) in a patient which involves obtaining CTLs from the patient, introducing into the CTLs the polymucleotide encoding the TCR and then introducing into the CTLs the polymucleotide encoding the TCR and then introducing the cells thus produced into the patient who has undergone an allogenic stem cell transplantation. Tumour reactive CTLs have been shown to mediate tumour regression in animals models by the inhibition of colony forming unit-granulocyte macrophage (CFU-GM) colony formation. The cancer is leukaemia which expresses the CD45 polypeptide. The method is useful as an immunotherapeutic for treating a patient with haematopoietic malignancy or to target and kill cells which express the CD45 polypeptide. The advantage this method provides is that the CTLs destroy the malignant haematopoietic cells but not the transplanted cells. The sequence presented is the peptide, huCD45/1218, comprising an HLA-binding peptide of human CD45
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

for

The invention relates to an isolated nucleic acid comprising at least 10 contiguous nucleotides of any of the 233 polymucleotide sequences given in the specification, or its complement. The nucleic acids encode cancerassociated proteins. Also included are an expression vector comprising the isolated nucleic acid cited above, a host cell comprising the above

claim 18; seqid 145; 310pp; English.

lymphoma and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC preventing a condition in which abnormally high levels of phosphotyrosine occur in a mammalian cell (which involves introducing into the mammalian cell and agent which comprises DNA or RNA encoding all or a portion of a CPTPH1, under conditions sufficient to express PTPH1 where the polypeptide can catalyse dephosphorylation of tyrosyl residues that are phosphorylated through action of a protein tyrosine kinase. The RNA is called useful for reversing a malignant phenotype of a mammalian cell which cis associated with tyrosyl phosphorylation catalysed by a protein cyrosine kinase. The DNA or RNA is delivered via a recombinant retrovirus cor a recombinant vaccinia virus. At least one tyrosyl residue that is composphorylated by the protein tyrosine phosphatase polypeptide can be aberrantly phosphorylated by pp60(V-src). The **RNA is useful for treating cor preventing malignancies such as breast cancer and leukaemia. The present sequence is a PTP similar to PTPH1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody that specifically binds to the polypeptide or its antigen-binding fragment; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid, comprising the polynucleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Best Loc

The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid molecule comprises an isolated nucleotides is an SNP given in the specification or its complement and encoding any one of the amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Translational profiling; expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; receptor; transcription factor; cancer; MIC; major histocompatability complex; myeloma; colon cancer; gastric cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor.

C transporter, cytoskeletal protein, receptor or transcription factor. The colypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class I MHC-binding polypeptide. The polypeptides and polypucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                              The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptore transcription factor. polypeptide is useful as an immunogenic composition for eliciting in mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polypucleotides are particularly useful for treating or preventing
                                                                                                            myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fragment of a kinase, phosphatase, protease, which comprises a fragment of a kinase, phosphatase, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polypucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a purified polypeptide, which comprises a CC fragment of a kinase, phosphatase, protease inhibitor, cramborter, cytoskeletal protein, receptor or transcription factor. The CC transporter, cytoskeletal protein, receptor or transcription factor. The CC polypeptide is useful as an immunogenic composition for eliciting in a CC mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this CC polypeptide. Is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed CC class I or class II MHC-binding polypeptide. The polypeptides and CC class I or class II MHC-binding polypeptide. The polypeptides and CC class I or class a II MHC-binding polypeptide. The polypeptides and CC class I or class II These are also useful for treating or preventing CC myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an capacitation but was obtained in electronic format directly from WIPO at the process of the print of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for identifying a protein tyrosine CC phosphatase (PTP) that is reversibly oxidized in a cell by: (i) CC subjecting a sample, including a cell that contains at least one PTP, to CC conditions that cause reversible oxidation of PTP; (ii) isolating PTP CC anaerobically, in presence of a sulfhydryl-reactive agent (II) that CC irreversibly modifies the thiol group of an invariant Cys in the active CC site of PTP; and (iii) determining, under reducing conditions, the level CC of dephosphorylation, caused by PTP, of a labelled substrate (III), where CC dephosphorylation indicates that an active PTP is present. No details CC of tests for these activities are given. The method is used to identify CC reversibly oxidized PTP, also to identify agents that: (a) reversibly CC modify such PTP; or (b) alter inducible signalling pathways in which PTP CC are involved. These agents are potentially useful, in human or veterinary CC medicine, for treating abnormal cell proliferation or growth (cancer);

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Translational profiling; expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; receptor; transcription factor; cancer; MHC;
                                                                                          New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.
                                                        treating cancer, e.g. colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-MAR-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a purified polypeptide, which comprises a configuration of a kinase, phosphatase, protease, protease inhibitor. The protein of a kinase, phosphatase, protease, protease inhibitor. The comporter, cytoskeletal protein, receptor or transcription factor. The pulpeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MfC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, Iymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the human kinase and phosphatase protein (KPP), designated KPP-20. The human KPP sequences from the present invention have cytostatic, antiarteriosclerotic, anticonvulsant, notropic, neuroprotective, cerebroprotective, anti-HIV, antiallergic, antiinflammatory and thyromimetic activities, and can be used in gene therapy. The human KPP proteins and polymucleotides can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of KPP, such as cell with the decreased expression or overexpression of KPP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. AIDS, allergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) disorders, or infections. They can also be used in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of KPP. The KPP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an isolated polypeptide comprising an amplified polypuncleotide or its antigen-binding cC that specification and plified polypuncleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in CC length; a kit for detecting an SNP in a nucleic acid, comprising the CC polypuncleotide, a buffer and an enzyme; a method of detecting an SNP in a cC mucleic acid molecule; a method of detecting a variant polypeptide; and a cC method for identifying an agent useful in treating or preventing cC myocardial infarction. The novel detection method has cardiant activity. The mucleic acids of the invention may be used in gene therapy. The cased crisk for developing myocardial infarction and for preparing a cc composition for treating or preventing myocardial infarction. This cc sequence represents the protein of a human myocardial infarction. Note: This sequence was not shown in the specification. The sequence has come from a electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino the specification or its complement and encoding any one of the amino
                                                                                                                                                                                                                                                                                                                                                                                human; adipocyte specific; adipose tissue; anti-obesity; high mobility group I-C protein; HMGI-C; obesity; leptin; ob; diabetes; adipogenesis; hypertension; cardiovascular disease; anorectic; antidiabetic; hypotensive; PTPase receptor type C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for identifying genes that are cover-expressed in adipose tissue and as such it provides targets for anti coopesity pharmaceutical compositions. Specifically, it refers to a high combility group 1-C protein (HMGI-C) that is associated with obesity and combility group 1-C protein (HMGI-C) that is associated with obesity and combility group 1-C protein (HMGI-C) that is associated with obesity and combility and combility and diabetes. The present composition describes performing differential gene expression analysis between the white adipose tissue (MAT) or stromal vascular tissue (SVT) cof any two different mice selected from a group consisting of wild-type, cof any two different mice selected from a group consisting of wild-type, cof any two different mice selected from a group consistingly, using this method novel nucleotides and the encoded proteins thereof were composited that are adipocyte specific, and as such can be used for preventing adipogenesis, diagnosing and treating diabetes, obesity, compounds that can modulate or prevent adipogenesis and treat diabetes or obesity. These compositions exhibit anorectic, antidiabetic and compositions exhibit anorectic, antidiabetic and processing and control of the invention of the invention of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best

has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention
